

# Machine Language

## Where we are at:

## Machine language is “the soul of the machine”

### Duality:

- Machine language (= instruction set) can be viewed as an abstract description of the hardware platform
- The hardware can be viewed as a means for realizing an abstract machine language

### Another duality:

- Binary version
- Symbolic version

### Loose definition:

- Machine language = an agreed upon formalism for manipulating a *memory* using a *processor* and a set of *registers*
- Varies across different hardware platforms.

## Binary and symbolic notation

```
1010 0011 0001 1001
```

```
ADD R3, R1, R9
```

Jacquard loom  
(1801)

### Evolution:

- Physical coding
- Symbolic documentation
- Symbolic coding
- Requires a *translator*.

Ada Lovelace  
(1815-1852)

## Lecture plan

---

- Machine languages at a glance
- The Hack machine language:
  - Symbolic version
  - Binary version
- Perspective.

## Arithmetic / logical operations

---

```
ADD R2,R1,R3 // R2←R1+R3 where R1,R2,R3 are registers

AND R1,R1,R2 // R1←bit wise And of R1 and R2

ADD R2,R1,foo // R2←R1+foo where foo stands for the value of the
               // memory location pointed at by the user-defined
               // label foo.
```

## Memory access

### Direct addressing:

```
LOAD R1,67 // R1←Memory[67]
// Or, assuming that bar refers to memory address 67:
LOAD R1,bar // R1←Memory[67]
```

### Immediate addressing:

```
LOADI R1,67 // R1←67
STORE R1,bar // bar←R1
```

### Indirect addressing:

```
// Translation of x=foo[j] or x=(foo+j):
ADD R1,foo,j // R1←foo+j
LOAD* R2,R1 // R2←memory[R1]
STORE R2,x // x←R2
```

## Flow of control

### Branching

```
JMP foo // unconditional jump
```

### Conditional branching

```
JGT R1,foo // If R1>0, goto foo
```

// in general:

*cond register, label*

Where: *cond* is JEQ, JNE, JGT, JGE, ...

*register* is R1, R2, ... and

*label* is a user-defined label

- And that's all you need in order to implement any high-level control structure in any programming language.

## A hardware abstraction (Hack)

- Registers:  $D, A$
- Data memory:  $M \equiv \text{RAM}[A]$
- ALU:  $\{D|A|M\} = \text{ALU}(D, A, M)$
- Instruction memory: current instruction =  $\text{ROM}[A]$
- Control: instruction memory is loaded with a sequence of instructions, one per memory location. The first instruction is stored in  $\text{ROM}[0]$
- Instruction set: A-instruction, C-instruction

## A-instruction

```
@value // A ← value
```

Where *value* is either a number or a symbol referring to some number.

### Used for:

- Entering a constant ( $A = \text{value}$ )
- Selecting a RAM location ( $M \equiv \text{RAM}[A]$ )
- Selecting a ROM location ( $\text{instruction} = \text{ROM}[A]$ ).

## C-instruction

```
dest = comp ; jump           // comp is mandatory
                             // dest and jump are optional
```

Where:

**comp** is one of:

```
0, 1, -1, D, A, !D, !A, -D, -A, D+1, A+1, D-1, A-1, D+A, D-A, A-D, D&A, D|A,
M, !M, -M, M+1, M-1, D+M, D-M, M-D, D&M, D|M
```

**dest** is one of:

```
Null, M, D, MD, A, AM, AD, AMD
```

**jump** is one of:

```
Null, JGT, JEQ, JGE, JLT, JNE, JLE, JMP
```

## Coding examples

1. Set A to 17

```
@value // set A to value
```

2. Set D to A-1

```
dest = comp ; jump
```

3. Set both A and D to A+1

4. Compute -1

5. Set D to 19

6. Set RAM[53] to 171

7. Set both A and D to A+D

8. Set RAM[5034] to D-1

9. Add 1 to RAM[7], and also store the result in D.

## Higher-level coding examples

10. `sum = 12`

11. `j = j + 1`

12. `q = sum + 12 - j`

13. `x[j] = 15`

Etc.

### Symbol table:

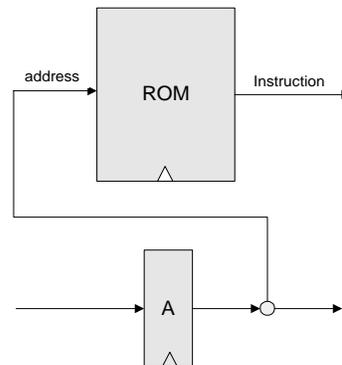

<code>y</code>	20
<code>j</code>	17
<code>sum</code>	22
<code>q</code>	21
<code>x</code>	16
<code>end</code>	507
<code>next</code>	112

`@value // set A to value`

`dest = comp ; jump`

## Control (first approximation)

- ROM = instruction memory
- Program = sequence of 16-bit numbers, starting at ROM[0]
- Current instruction = ROM[address]
- To select instruction  $n$  from the ROM, we set A to  $n$ , using the command `@n`

## Coding branching operations (examples)

Symbol table:

y	20
j	17
sum	22
q	21
X	16
end	507
next	112

Low level:

1. IF D=0 GOTO 112
2. IF D-12<5 GOTO 507
3. IF D-1>RAM[12] GOTO 112

Higher level:

4. IF sum>0 GOTO end
5. IF x[i]-12<=y GOTO next

C-instruction

```
dest = comp ; jump
```

where jump is one of:

```
Null, JGT, JEQ, JGE,  
JLT, JNE, JLE, JMP
```

## Flow of control operations (IF logic)

High level:

```
IF condition {  
  code segment 1}  
ELSE {  
  code segment 2}  
Etc.
```

Low level (goto logic)

```
D ← not(condition)  
IF D=0 GOTO if_true  
ELSE  
  code segment 2  
  GOTO end  
if_true:  
  code segment 1  
end:  
Etc.
```

Hack:

```
D ← not(condition)  
@IF_TRUE  
D;JEQ  
code segment 2  
@END  
0;JMP  
(IF_TRUE)  
code segment 1  
(END)  
Etc.
```

- To prevent conflicting use of the A register, in well-written programs a C-instruction that includes a jump directive should not contain a reference to M, and vice versa.

## Flow of control operations (WHILE logic)

High level:

```
WHILE condition {  
    code segment 1  
}  
code segment 2
```

Hack:

```
(LOOP)  
    @END  
    D ← not(condition)  
    D;jeq  
    code segment 1  
    @LOOP  
    0;jmp  
(END)  
    code segment 2
```

## Complete program example

C:

```
// Adds 1+...+100.  
int i = 1;  
int sum = 0;  
while (i <= 100){  
    sum += i;  
    i++;  
}
```

## Lecture plan

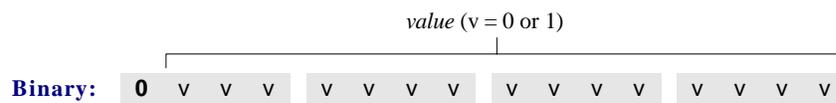

---

- Symbolic machine language
- Binary machine language

## A-instruction

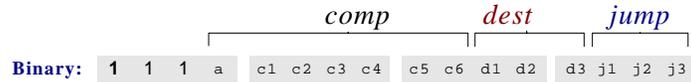

---

**Symbolic:** `@value` // Where *value* is either a non-negative decimal number  
// or a symbol referring to such number.

## C-instruction

**Symbolic:** *dest=comp; jump* // Either the *dest* or *jump* fields may be empty.

(when a=0) <i>comp</i>	c1	c2	c3	c4	c5	c6	(when a=1) <i>comp</i>	d1	d2	d3	Mnemonic	Destination (where to store the computed value)
0	1	0	1	0	1	0		0	0	0	null	The value is not stored anywhere
1	1	1	1	1	1	1		0	0	1	M	Memory[A] (memory register addressed by A)
-1	1	1	1	0	1	0		0	1	0	D	D register
D	0	0	1	1	0	0		0	1	1	MD	Memory[A] and D register
A	1	1	0	0	0	0	M	1	0	0	A	A register
!D	0	0	1	1	0	1		1	0	1	AM	A register and Memory[A]
!A	1	1	0	0	0	1	!M	1	1	0	AD	A register and D register
-D	0	0	1	1	1	1		1	1	1	AMD	A register, Memory[A], and D register
-A	1	1	0	0	1	1	-M					
D+1	0	1	1	1	1	1						
A+1	1	1	0	1	1	1	M+1					
D-1	0	0	1	1	1	0						
A-1	1	1	0	0	1	0	M-1					
D+A	0	0	0	0	1	0	D+M					
D-A	0	1	0	0	1	1	D-H					
A-D	0	0	0	1	1	1	M-D					
D&A	0	0	0	0	0	0	D&M					
D A	0	1	0	1	0	1	D M					

j1 (out < 0)	j2 (out = 0)	j3 (out > 0)	Mnemonic	Effect
0	0	0	null	No jump
0	0	1	JGT	If out > 0 jump
0	1	0	JEQ	If out = 0 jump
0	1	1	JGE	If out ≥ 0 jump
1	0	0	JLT	If out < 0 jump
1	0	1	JNE	If out ≠ 0 jump
1	1	0	JLE	If out ≤ 0 jump
1	1	1	JMP	Jump

Elements of Computing Systems

21

Machine Language (Ch. 4)

## Symbols (user-defined)

- Label symbols:** User-defined symbols, used to label destinations of goto commands. Declared by the pseudo command (**Xxxx**). This directive defines the symbol **Xxxx** to refer to the instruction memory location holding the next command in the program
- Variable symbols:** Any user-defined symbol **Xxxx** appearing in an assembly program that is not defined elsewhere using the "(**Xxxx**)" directive is treated as a variable, and is assigned a unique memory address by the assembler, starting at RAM address 16.

```
// Rect program
@R0
D=M
@INFINITE_LOOP
D;JLE
@counter
M=D
@SCREEN
D=A
@addr
M=D
(LABEL)
@addr
A=M
M=-1
@addr
D=M
@32
D=D+A
@addr
M=D
@counter
MD=M-1
@LOOP
D;JGT
(INFINITE_LOOP)
@INFINITE_LOOP
0;JMP
```

Elements of Computing Systems

22

Machine Language (Ch. 4)

## Symbols (pre-defined)

- Virtual registers: **R0**,...,**R15** are predefined to be 0,...,15
- I/O pointers: The symbols **SCREEN** and **KBD** are predefined to be 16384 and 24576, respectively (base addresses of the *screen* and *keyboard* memory maps)
- Predefined pointers: the symbols **SP**, **LCL**, **ARG**, **THIS**, and **THAT** are predefined to be 0 to 4, respectively.

```
// Rect program
@R0
D=M
@INFINITE_LOOP
D;JLE
@counter
M=D
@SCREEN
D=A
@addr
M=D
(LOOP)
@addr
A=M
M=-1
@addr
D=M
@32
D=D+A
@addr
M=D
@counter
MD=M-1
@LOOP
D;JGT
(INFINITE_LOOP)
@INFINITE_LOOP
0;JMP
```

## Perspective

- Hack is a simple language
- User friendly syntax: **D=D+A** instead of **ADD D,D,A**
- Hack is a “1/2-address machine”
- A Macro-language can be easily developed
- Assembler.
